What's included

- ✓ **Certificate.days_until_expiry** helper — whole days to valid_to (negative once expired, None when perpetual); drives the day-counts.

✓ **OverviewView** orders needs_attention() **most-urgent-first** and splits the counts into certs_expired_count / certs_expiring_count.

✓ **Overview compliance panel** (replaces the old one-line alert):

✓ Red treatment when anything is expired, else amber.
- ✓ Summary line — *N expired · M expiring within 60 days.*

✓ Per-certificate rows: validity chip, name (links to the cert editor), category/issuer, and **"expired N days ago"** / **"expires in N days"** + the date.

✓ **Refactor:** extracted the validity chip into a reusable **_status_chip.html** partial, now shared by the certificate table and the Overview panel (removes duplicated markup).

✓ Editors still never see the panel (administrator-gated, unchanged).
